// Création des objets / create Objects
ESP8266WebServer server ( 80 );
/*
Tout le code HTML reste une simple chaîne de caractère facile à
manipuler. Vous avez du voir
dans le texte qu'il y a des %s %0.1d et %u. Ce sont les emplacements
des données que l'on va
actualiser à chaque fois que la page change.
Pour mettre à jour la page, il suffit de remplacer chaque variable par
sa valeur, voici comment faire:
On détermine la taille de la page (le nombre de caractères). par
sécurité, vous pouvez ajouter
quelques caractères supplémentaires.
*/
//int pagesize = sizeof(page) + 10;
// On prépare un buffer qui contiendra la page modifiée
//char newpage[pagesize] = "";
/*
Maintenant, il suffit de substituer chaque variable par sa valeur à
l'aide de la méthode sprintf
en utilisant le format indiqué. Par exemple %s pour une chaîne, %0.1d
pour un nombre décimal avec

```

```
un chiffre derrière la virgule...
*/
// Fonction getpage: mise à jour du contenu de la page HTML
String getPage()
{
  // Préparation de la page Internet
  char newpage[(sizeof(page) + 10)] = "";
  sprintf(newpage, page, t, h, p, etatLed);
  //sprintf(newpage, page, 11, 22, 33, etatLed);
  return newpage;
