# Exécutez un test de rampe pour trouver le point de focalisation idéal de votre laser

Rédigé par COMsulting GmbH.

Measure the distance from the seam just above the air intake to the center of the material. Move the bed up or down to adjust. The cut line will look something like above. Start fat and get thinner and then fat again. Measure the distance from the thinnest point to A. This is the actual distance when focusing to the top of the material. Adjust when cutting to place the focal point in the middle (center) of the material.
